

How Do I Get the Threbank Precious Wood Putter Grip?

Obviously, it is hard to find this grip in your normal golf store. Each grip is individually mounted onto the customer's putter in our workshop. After a few days we send your putter back and you can start putting with it right away.

As a start look to our website:
www.threbank.com.

Of course you can phone in for questions or email:

Am Bibergarten 21 / 92318 Neumarkt i. d. Opf.

Get a Grip on Putting

It is not the putter that makes successful putts, it's the hand that leads the putter. And how does the hand lead and control the putter? Through the putter grip! This is why the grip as interface between hand and putter is essential for success on the green.

Feedback Instead of Dullness

Usually putter grips are made of rubber or thermoplastics. This widely used material delivers good damping. But if you take a close look to this damping, it turns out to be counterproductive. What makes sense with drivers, woods or irons is unwanted for putting. On the green you need a good sense of touch and a direct feedback.

Everything Under Control

Successful putts depend on direction and length. With the four-sided grip profile of Threbank putter grips and their ergonomically rounded corners it is easy to:

- ✓ target the hole
- ✓ achieve a repeatable grip position
- ✓ keep the desired direction

Twisting the putter while putting is hardly possible.

Types of Wood

Out of a variety of woods we have selected five kinds that meet the special requirements such as durability for our exclusive putter grips. All types are premium quality woods from their regions with comparable characteristics. You decide which one suits your personal taste best.

Amazakoue (Ovengkol)

West African, Cost countries

The wood is brown to olive brown, regularly with distinctive dark brown stripes.

Rosewood/Morado (Santos Palisander)

South America, Central Brazil

Yellowish-brown to reddish-violet with random dark brown to black areas.

Oak (Fumed)

Central Europe, Germany

Dark brown. For a consistent look after the smoking process, the trees for our putter grips are carefully selected.

Wenge

Central Africa

Dark brown to coffee black with light brown stripes in his structure pattern. The darkest type of grip we offer.

Zebra wood

West Africa

Golden yellow with dark brown stripes. Our lightest-colored grip.

There is More to Precious Wood than Precious Looks

Threbank precious wood putter grips are not only visual upgrades. They are transmitters. When putting, the putter-head vibrations run through the shaft directly into the grip onto your tactile sense. The player gets an unrivaled feedback depending on the distance. This enables a continuous learning process and the repeatability of putts in equal situations.

Several Grip Sizes Available

For an individual grip feeling, Threbank precious wood grips are made in two grip sizes. The basic design is identical:

The Classic-Line

Most common grip-size, which suits most players.

The Modern-Line

The circumference was increased by 12 mm compared to the classic-line. This meets the growing trend for larger grips.
